Introduction

A Personal Health Record Monitoring System is a software used to store and manage a person’s health information digitally. It helps users keep track of medical history, reports, and treatments in one place. This system makes accessing health data easy, saves time, and improves healthcaremanagement

Objective

The main objective of the Personal Health Record Monitoring System is to store and manage a user's health information in a digital format. It aims to provide easy access to medical records, improve data accuracy, and help in better healthcare management.

Problem Statement

Managing personal health records manually is difficult and time-consuming. Important medical information can be lost, misplaced, or not available when needed. This creates problems in emergencies and affects proper treatment. Therefore, there is a need for a system that can store and manage health records safely and easily.

System Requirements

Hardware Requirements:
Computer / Laptop
Minimum 4 GB RAM
Hard Disk (for storage)

Software Requirements:
Operating System (Windows / Linux)
Java (JDK)
IDE (NetBeans / Eclipse)
Swing (for GUI)

System Design

The Personal Health Record Monitoring System is designed using a simple structure with a user-friendly GUI. It includes modules like user registration, login, and health record management.
The system follows an object-oriented approach where different classes handle user details, medical records, and file storage. Data is stored securely and can be accessed or updated when needed. The GUI allows users to easily enter, view, and manage their health information.

Module Description

The Personal Health Record Monitoring System follows a simple object-oriented model. It consists of different modules such as user, health record, and system interface.
Each module performs a specific function like storing user details, managing medical data, and displaying information through the GUI. The system processes input from the user, stores it in files, and retrieves it when needed, ensuring easy and efficient health record management.

Algorithm / Flowchart

Start
User registers or logs in
Enter personal and health details
Store data in file/database
Display options (view/update/delete records)
User selects required action
Perform operation and update data
Logout
Stop

Implementation

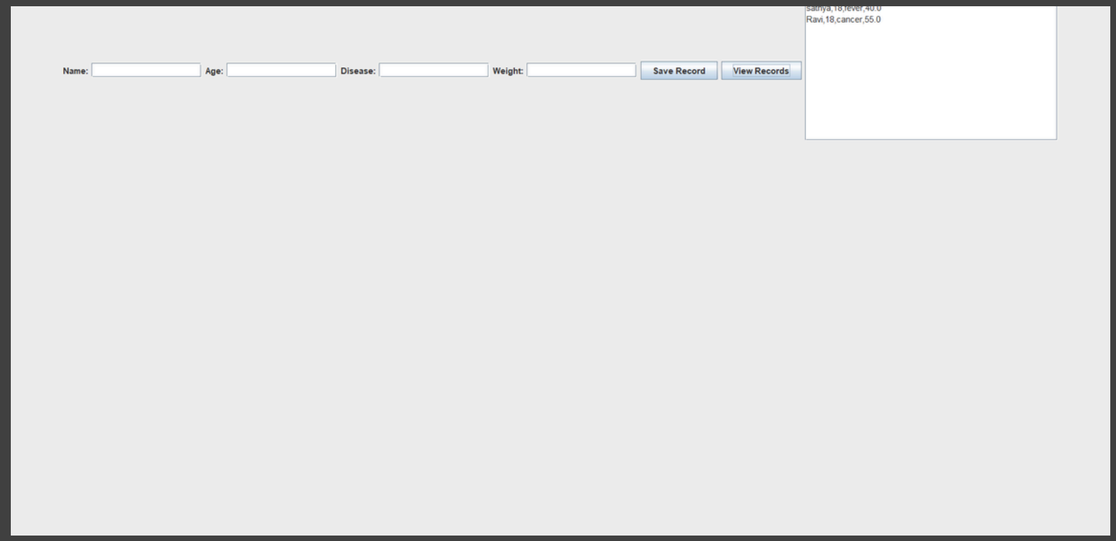

The Personal Health Record Monitoring System is implemented using Java with Swing GUI for the user interface. The system is developed using object-oriented programming concepts like classes, objects, inheritance, and polymorphism.
User details and health records are stored using file handling. The application provides features like registration, login, adding, viewing, updating, and deleting health records. Exception handling is used to manage errors, and the GUI makes the system easy to use.

Results & Discussion

The Personal Health Record Monitoring System was successfully developed and tested. The system allows users to store, view, and manage their health records easily.
It reduces manual work, saves time, and ensures data is stored safely. The user-friendly interface makes it simple to use. Overall, the system improves healthcare record management and helps in quick access to important medical information.

Conclusion & Future Enhancement

Conclusion
The system helps store and manage health records easily and safely in digital form.

Future Enhancement
Add cloud access
Improve security
Create mobile app
Add reminders
